END NOTE

November 3, 2021

- Being an aspiring software engineer as well as game developer, my pick of the bunch was not a very difficult one for me to decide.

C++ as well as Java are both widely used languages for game development.

Whereas C++ can compile all C programs virtually allowing the developer to reuse C software, Java programs run faster than C++. They are alos quite basic and also easier to write than C which is basically an expert-only language.

With all things said, my favorite language would have to be Java for the above reasons.
